**TIS-RP**

# Contents

- Details about PMI chamber
- Experimental area + set-up
- Simulation results
- Measurement results
- Comparison between simulation and measurement
- Conclusion

# Simulation picture of the PMI chamber

Hull composition:  
 $C-H_2$

Filling gas: air  
atmospheric pressure

Active volume: 3l

Working voltage:  
~460 V

# Experimental set-up in the CERF target area

SPS secondary hadron beam is hitting a copper target → leading to irradiation of the PMI chambers with different radiation fields at various positions.

Beam parameters:

Momentum:  
120 GeV/c

Intensity:  
 $9 \cdot 10^7$  hadrons/  
SPS extraction

Beam composition:  
60.7%  $\pi^+$   
34.8 % protons  
4.5 %  $K^+$

# Simulation results

- Analysis of the fluence reaching the various detector positions.
- Analysis of the simulated counting rate at the various detector positions.

# Analysis of the fluence reaching the various detector positions

## Particle fluence at detector position 2

# Particle fluence at detector position 4

# Particle fluence at detector position 6

# Number of particles per primary particle hitting the various detector positions (including also particles below 0.1 MeV)

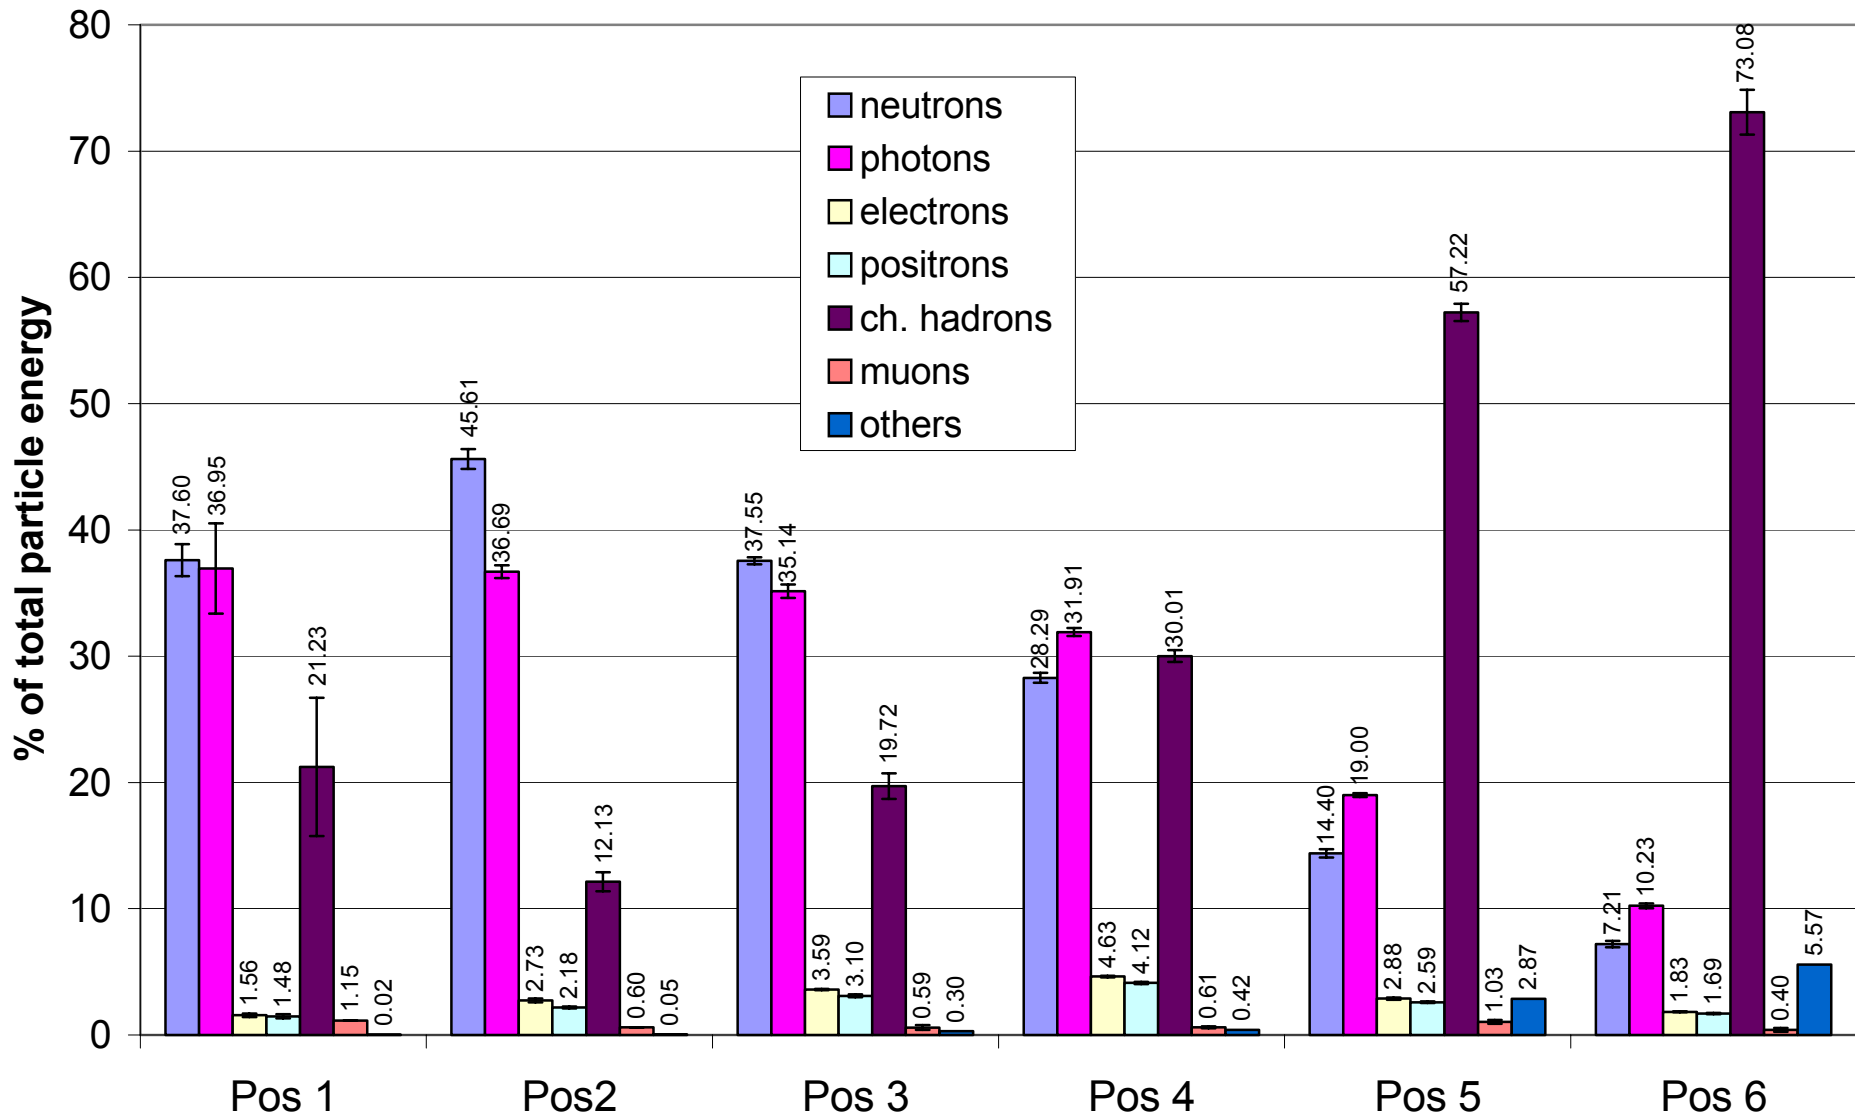

# Fraction of the particle types reaching the various detector positions

# Energy per primary particle transported towards the various detector positions

# Fraction of the energy as a function of the particle types reaching the detector positions

# Analysis of the simulated counting rate at the various detector positions

## Procedure to achieve simulated counting rate

FLUKA calculation of energy deposition in active volume of chamber

“Energy to ion<sup>+</sup>/e<sup>-</sup>” conversion factor leads to number of produced ion<sup>+</sup>/e<sup>-</sup> pairs.

Conversion of number of ion<sup>+</sup>/e<sup>-</sup> pairs into pC.

One pC corresponds with one PMI counts.

# Simulation result of the counting rate

Position	Counts/ prim. particle $\times 10^{-6}$	Error of mean $\times 10^{-6}$
Pos 1	5,63	$\pm 0,12$
Pos 2	16,06	$\pm 0,44$
Pos 3	67,46	$\pm 0,73$
Pos 4	85,33	$\pm 0,64$
Pos 5	96,20	$\pm 1,26$
Pos 6	108,31	$\pm 0,82$

1 Counts = 10 nGy deposited in active volume

# Influence of the different particle types (%) to the final counting rate of the detectors at the various positions

# Comparison between simulation and measurement results

Position	Simulation Counts/ prim. part. $*10^{-6}$	Simulation error $*10^{-6}$	Measurement Counts/ prim. part. $*10^{-6}$	Measurement error $*10^{-6}$	Simulation/ Measurement	Error
Pos 1	5,63	$\pm 0,12$	5,64	$\pm 0,56$	0.998	$\pm 0.102$
Pos 2	16,06	$\pm 0,44$	15,58	$\pm 1,56$	1.031	$\pm 0.107$
Pos 3	67,46	$\pm 0,73$	67,25	$\pm 6,93$	1.003	$\pm 0.104$
Pos 4	85,33	$\pm 0,64$	79,00	$\pm 8,67$	1.080	$\pm 0.119$
Pos 5	96,20	$\pm 1,26$	89,39	$\pm 9,47$	1.076	$\pm 0.115$
Pos 6	108,31	$\pm 0,82$	115,74	$\pm 17,99$	0.936	$\pm 0.146$

1 Counts = 10 nGy deposited in active volume

# Conclusion

- PMI monitor response measurements in the CERF radiation field were performed in August 2003
- Simulations of these measurements were done in order to understand the physics leading to the counting rate results.
- Very good agreement between the simulations and the measurements was achieved
- In terms of number of particles reaching the PMIs, photons dominate in all 6 positions.
- Neutrons dominate the energy transported towards Position 1, charged hadrons the one towards Position 6.
- The contribution to the final counting rate is dominated by neutrons in Position 1 and by electrons and positrons in Position 6.
