

Results from Muon Chamber Analysis

Behaviour of CNGS Muon Detectors

Aurélien Marsili

Bernd Dehning, Gianfranco Ferioli,
Edda Gschwendtner, Eva Barbara Holzer

Contents

- 1) General presentation of the experiment
- 2) Description of 2007 data
- 3) Unexpected behaviour
- 4) Comparison with 2006 data

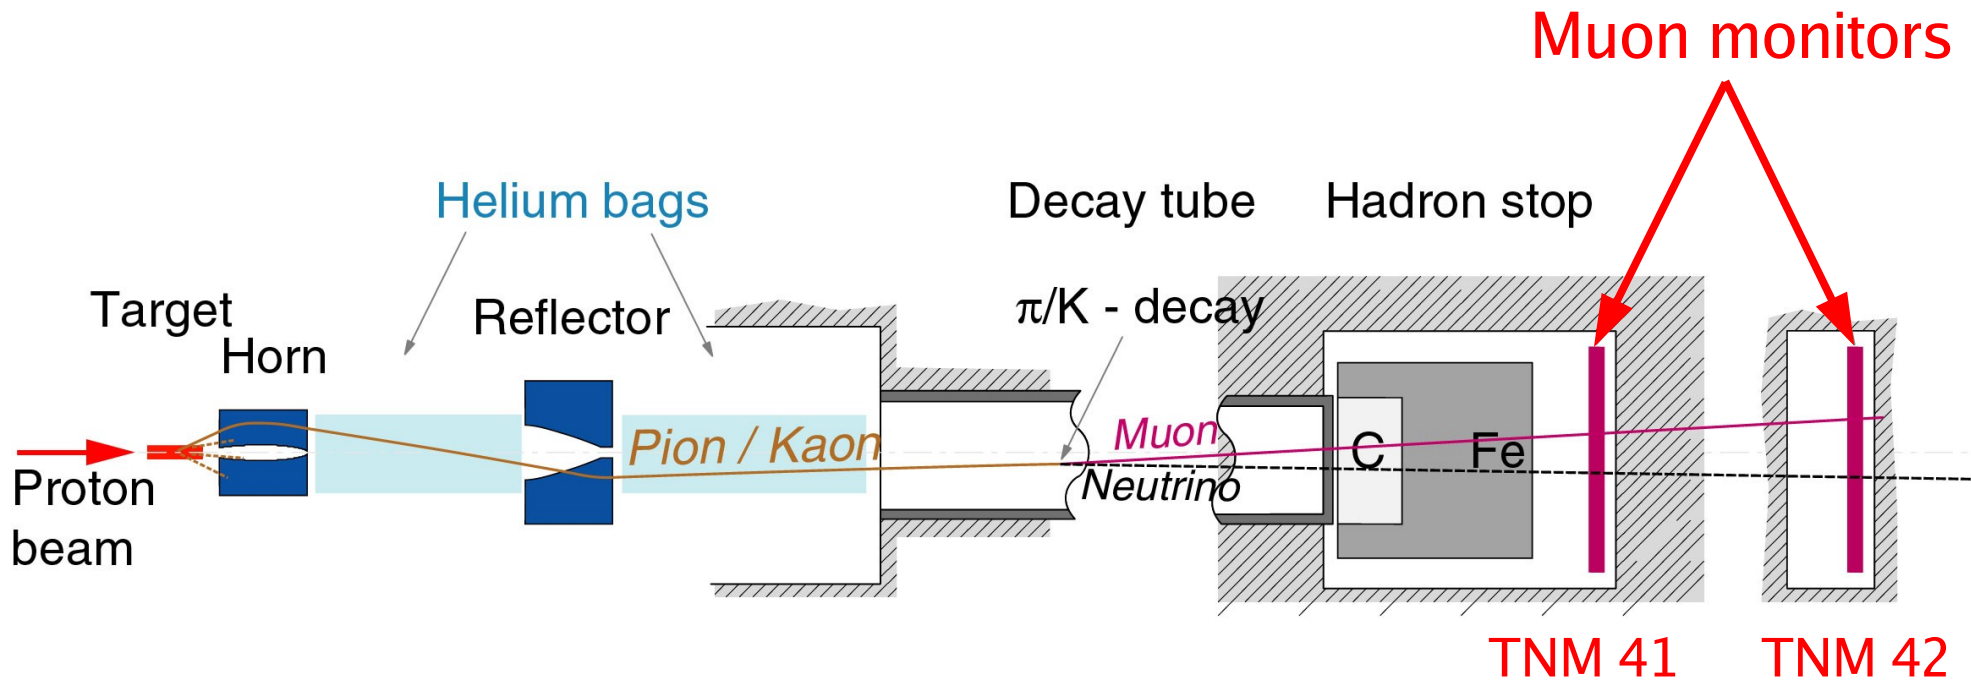

Behaviour of CNGS Muon Detectors

1

General presentation of the experiment

Global structure of the CNGS experiment

- 1

Measuring muons \Leftrightarrow Measuring neutrinos

One 'cross'

- 42 detectors:
 $4 \times 10 + 1 + 1$
- Sorted by direction:
 - Horizontal
 - Vertical
- Sorted by cross number:
 - 41
 - 42

LHC Beam Loss Monitors

- Ionization chambers
 - 50 x 16 x 16 cm
 - 61 electrodes
 - N₂, 1.1 bar
- Electric field:
 - 2006: 1600 V/cm
 - 2007: 2400 V/cm
- Charged particles ionize the gas, and ions/e⁻ drift

Vocabulary...

1

- Intensity: protons on target (p.o.t.)
- Collected charges:
 - Number of charges collected from the detector
 - Should be proportional to intensity
- Detector signal (charges / p.o.t.)
- Extractions 1 & 2, lasting $10.5 \mu\text{s}$ each, separated by 50 ms.
- 1 supercycle = 39.6 s
 - 3 CNGS cycles, 6s each.

Timing

- 1 supercycle = 3 cycles x 2 extractions

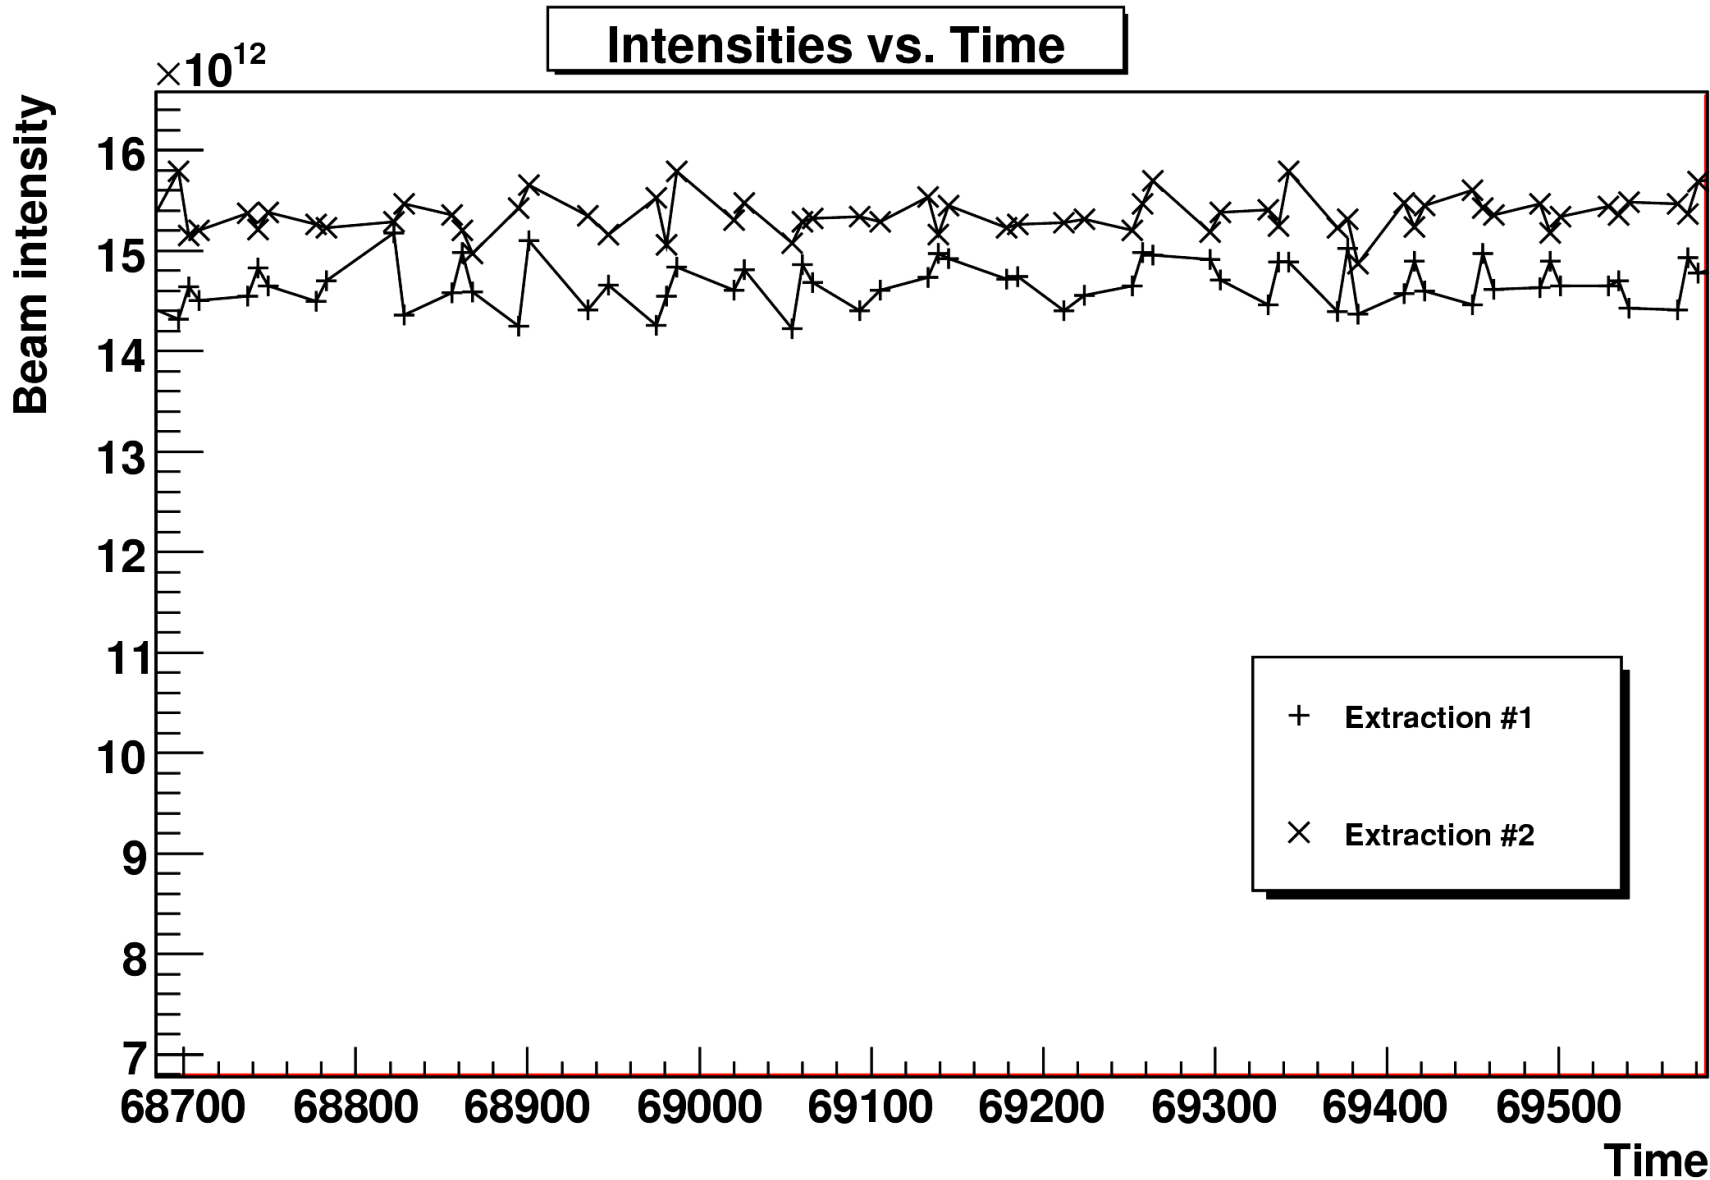

Behaviour of CNGS Muon Detectors

About this unexpected
behaviour...

Comparison horizontal/vertical

Comparison horizontal/vertical

Non-linear behaviour: checks

- ✓ Origin of the detector
 - ✓ 2 productions centers: CERN and Protvino

- ✓ Electronic cards:
 - 16 channels per card
 - Some detectors from vertical and horizontal are connected to the same card

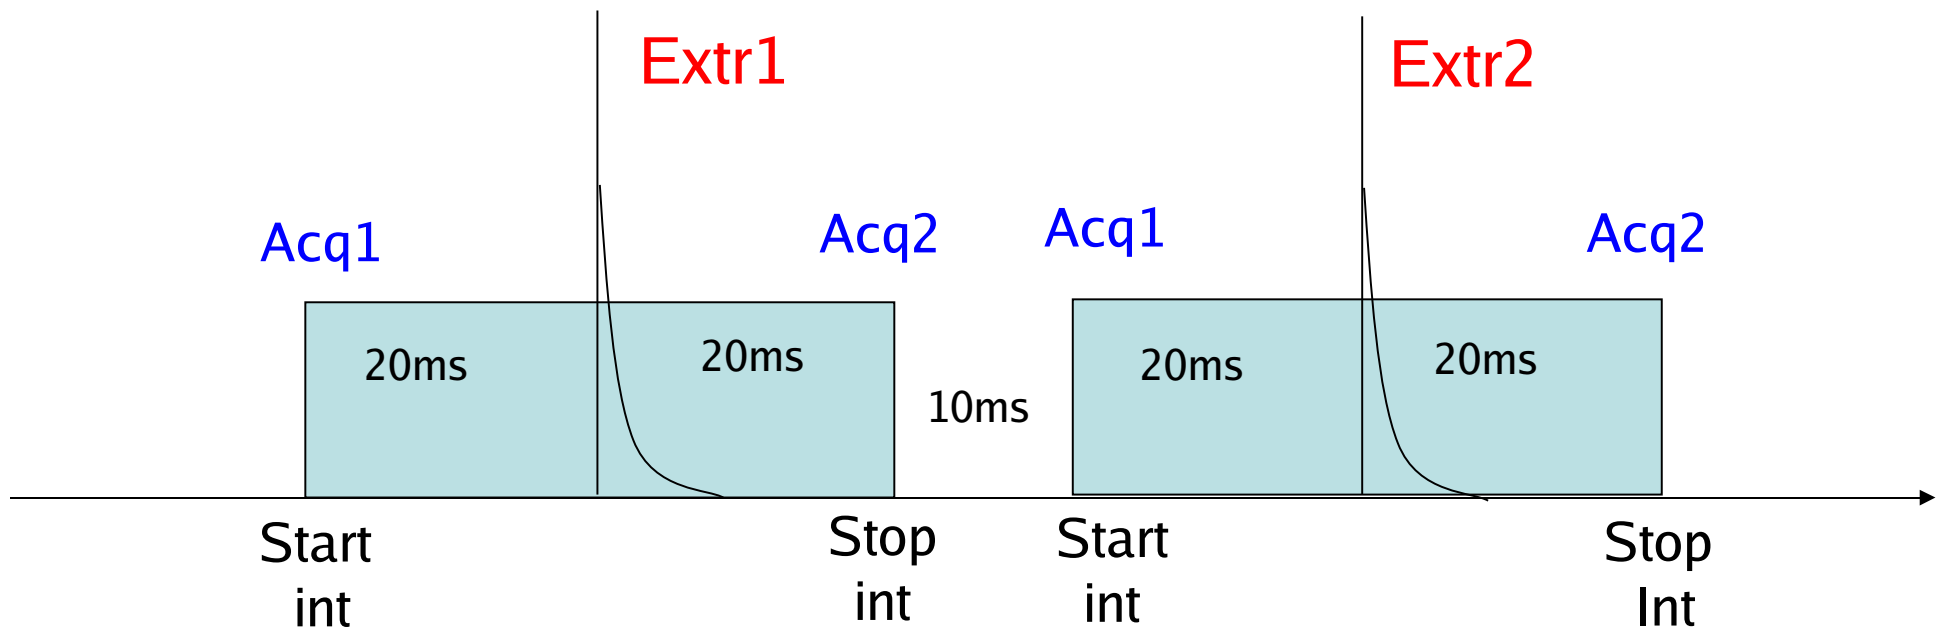

- All cards were removed from the tunnel and checked separately.
 - ✓ linearity

Non-linear behaviour: checks

✓ Timing

- ✓ No lost charges
- ✓ Avoid 50 Hz noise

Acquisition at 50Hz

Muon Detector Timing and Cabling

✓ Cabling Topology

- Multiwire cables for horizontal detectors (cross-talk)
- Multiwire cable for vertical detectors, twisting around horizontal ones (external part: high capacity between cables and ground)

Cross 41, H

Non-linear behaviour: checks

- No threshold on X axis (pot)
- No threshold on Y axis (ch/pot)
- No dependence on centroids (position of the center of the beam profile)

2008: changes to the system

- A 220 nF capacitor was added between each wire and the shielding, making it the dominant one (cable capacitance: 35 nF)
- $V = Q/C \Rightarrow V \text{ drops} \Rightarrow \text{less coupling}$
- Discharging time increases $\Rightarrow \sim 5 \text{ ms}$
(still short enough)

Behaviour of CNGS Muon Detectors

Comparison with 2006 data

4

2006 results

- 2006: 1600 V/cm
– Non-linear effect
- 2007: 2400 V/cm
– No effect
- Under investigations...
– Recombination losses
– Space charge effect

Behaviour of CNGS Muon Detectors

RMS Calculation

RMS Calculation

signal of detector #11 vs intensity

distribution of detector #11

signal of detector #11 vs intensity, cycle 1

signal of detector #11 vs intensity, cycle 2

signal of detector #11 vs intensity, cycle 3

1st cycle distribution

2nd cycle distribution

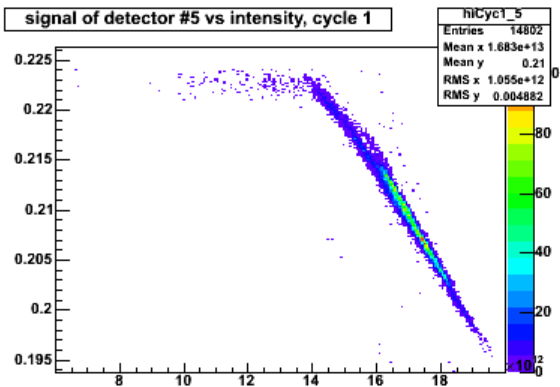

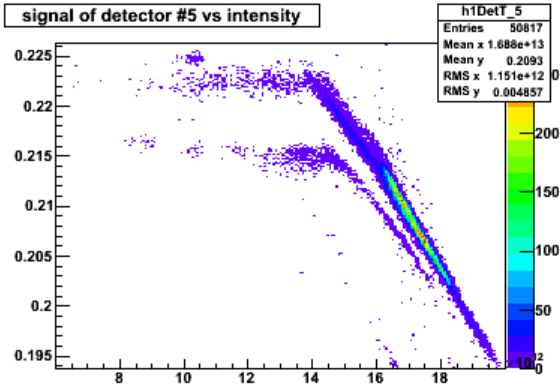

3rd cycle distribution

RMS Calculation: incorrect detector

Characteristic values for 2007

- Extraction: $10.5 \mu\text{s}$
- e- drift: 200 ns
- Ions drift: $200 \mu\text{s}$
- Cables: 800m, 32 nF
- Resistor: 5 kOhm
- Electronic input
 - Voltage rise time: $200 \mu\text{s}$
 - Characteristic decay time: $160 \mu\text{s}$
 - Total discharge time = $5 * 160 = 0.8 \text{ ms}$
